Interaction of unpolarized capacitors with human mental field and bio-fields. VIII. Dielectrics with highly oriented crystalline structure.

New vision on material science opens a new era in the knowledge of Life.

Measurements on pairs of unpolarized capacitors with highly oriented dielectrics are resumed [1] in the present note by using a new circuitry (differential amplifiers with $A=1000$). Figure 1 shows details on that (figures represent measuring channels) and Table 1 gives the exact distribution of capacitors along channels. Measurements were carried out at every the four main Moon phases on the calendar period of time between 28th January up to 25th May 2017. Although the actual and the previous studies [2] showed that Moon phases have not visible effects on results, their periodicity at 7-8 days allows evidencing the concurrent activities of Human Mental Field (HMF) and other Bio-Fields (BF) over the great calendar period of time.

The resulted 18 graphs for $U_{dc}(HOD)$ ($HOD = \text{Hour of the Day}$) for only pair of quartz resonators of 2 MHz (denoted as 2Q2MHz) are given at the end of this note. More experimental details are available in previous notes of this series. It is important to mention that:

- (i) at the present series of measurements the polarity of U_{dc} variations have reverse polarity than the previous ones with different circuitry, although the quartz resonators are the same and connected to the same IN+ and IN-;
- (ii) all the other pairs showed the same shape of $U_{dc}(HOD)$, but with different polarity and amplitude. Figure 2 (at the end) shows the relative amplitude of each channel reported at the channel 1. I changed capacitor pairs at different channel and the same amplitude resulted. It appears as capacitor pairs mutually interact, but with different coupling values and/or the their spatial position governs the amplitude.
- (iii) another 7 channels were added (not shown in Figure 1) to the 8 measurement channels with similar circuitry by using the data logger Graphtec GL 200 (16 bit) previously used in similar measurements on water and aqueous solutions [3, 4]. Pairs of quartz resonators of 2 and 4 MHz showed the same shape of $U_{dc}(HOD)$, but the other pairs of capacitors with polymer films showed high noisy inferences;
- (iv) Figure 3 shows that HMF dominates in cold weather and it is compensated by BF in warm weather. As in the previous results, it is also evidenced on $U_{dc}(HOD)$ that BF activity is triggered by rising sun and warm weather. More details in next notes.

Figure 1. Pictures of measuring circuitry.

HuPoTest – data base correlations revealing mental pattern.

Mind survives.

Thorough studies showed that HuPoTest parameters obtained on a specific period of time for a Person Under Test (PUT) depend mainly on Hour of the Day (HOD), but correlations of their databases can reveal his mental pattern [1, 2]. The origin of these correlations stands in establishing the calibration pattern of a general measuring instrument [3-5], so HuPoTest appears as the calibration of the individual PUT timer. Unfortunately, majority of parameters defined on a huge number of PUT along 50 years of intense research are not available for HuPoTest users. Furthermore, the free software available on the website needs Windows on 32 bit, so I decided to recommend the procedure using stopwatch and the help of another person noting the y_{ij} values. I used initially and I am using continuously this procedure in view to establish new parameters and/or deeper significances [6, 7]. I have posted also the Excel 2003 template where values y_{ij} must transfer and basic parameters are calculated automatically (Figure 1) and the graph containing all data results (Figure 1). I am suspicious about the ability of most users in handling Excel, especially the young ones as the main target of HuPoTest, Any how, this procedure is easier than the free software.

The first correlation performed on a data base of parameters [1] was between slope and intercept, resulting also a linear relationship, but with smaller values of correlation coefficient and greater standard deviations of so called affine/linear parameters ($n1$, $m1$).

HuPoTest results obtained by myself on March-May 2014 are considered in this note in view to reveal mental pattern evidenced by some simple correlations further available for any PUT by using the recommended procedure.

Figure 2 shows the basic linear correlation between slope and intercept. It is important to mention that error bars for each point are calculated with formula not included in the Excel template, but not absolutely necessary for further evaluations.

Figure 3 shows the linear correlation between Δa and Δb , new parameter introduced in Excel template defined on the parameter $pyj = \text{product}(y_{ij})$. This parameter was previously introduced, but defining a sigmoid correlation [2]. The associated error bars affecting (Δa , Δb) and ($n1$, $m1$) parameters are smaller than the ones in Figure 2 and the points are more clear grouped along the straight line.

Figures 4-7 show the correlations between pairs from the four parameters. It is important to observe the good linear relationship between slope and intercept with Δa , respectively, and finally to conclude that all these affine parameters ($n1$, $m1$) can define the PUT mental pattern on the period of time considered. The following steps are necessary to establish mental pattern:

- 1- create a special folder with HuPoTest results;
- 2- create a special Excel document under a specific name (ex. Florin-12.03-15.0617.xls) and save on the Sheet1 all y_{ij} values with the mention of date and HOD for each set;
- 3- prior to close Excel template: print the graphic as pdf and save it under a suggestive name (ex. Florin-12.03.17-12.30.pdf); do not save modifications in view to keep all its initial settings;
- 4-all parameters collected from graphics must be transferred on next Sheet(s) in Excel document (pt.2) in view to further retrieve according to linear regression by using slope, intercept and correl functions from Excel library for all above mentioned ($n1$, $m1$) parameters.
