GDF DATABANKS BULLETIN, VOL. 25, NO. 3, 2021 ISSN 1453 - 1674 Structural aspects of temperature phase transition in PTC-thermistors. III. Several features of hysteresis behavior

Structural transition in PTC thermistors (PTC-TH) intrigued because the suspicion of the existence of an inductive element as in a series of polymers [1], water and aqueous solutions [2].But, before to directly evidence the inductive interaction between two or more specimens, it is necessary to establish in more details composite structure associated to transition according to topoenergetic principles. In previous notes these transitions were evidenced at fixed temperatures [3] and in dynamic regime [4] by heating and cooling with constant rate and measuring electric and calorimetric (DTA – differential thermal analysis) behavior of one specimen.

The goal of the present note is to analyze in more detail hysteresis behavior arising between heating and cooling variations of Uout(T) at different Us values considered as the driving potential. Only one specimen, namely PTFL04BH471Q2N34B0 (Murata) with Tc around 60 $^{\circ}$ C [1] is analyzed in view to establish the exact experimental conditions for next experiments on a series of PTC-TH specimens.

Variation Uout(T) is perfectly fitted by Logistic sigmoidal function

$$Uout(T) = a/(1 + b^*exp(-c^*T))$$
(1).

Calculated values of Uout(T) with #1^oC steps are considered to estimate the difference

$$dUout(T) = Uout(T, HEATING) - Uout(T, COOLING)$$
(2)

between heating and cooling thermograms and finally the maximum and the area = sum of dUout > 0 values both in mV.

Figure 1 shows the variation of dUout(T) for different Us values.

Figures 2 and 3 show the linear variation of area and maximum (peak height) values with Us, respectively, but revealing an exponential distance between points. As in the other calorimetric and/or other measurements revealing energy effects of transformation processes, it is important to take into consideration their form factor (FF) defined as

$$FF = area/peak height, (d-less)$$
 (3).

Figure 4 shows the variation FF(Us) perfectly fitted by an exponential function revealing also exponential distance between points.

Figures 5 and 6 show that UNIVERSAL topoenergetic law is acting also on these experimental data, so by analyzing a series of PTC-TH specimens in the same experimental conditions it is possible to establish a data banks revealing the nature and amplitude of the evidenced phase transitions in direct connection with their structures.

Chapter 1

Foreword

Miguel de Cervantes Saavedras: "Experience is the mother of all sciences"

My deep concern is that the present book will not affect in any way human society, although I tried to point out arguments about the next imminent nuclear conflict mainly caused by continuous and accelerated degradation of human mind in direct correlation with uncontrolled growth of population. Survivors will be only ones with properly prepared minds. These two facts are striking evidences for any one, no matter education and place on the planet Earth. The solution I propose is to permanently testing and improving our mind. Its name is HuPoTest I experienced and developed continuously for more than 50 years. Human mind is our "crazy horse" which no individual succeed to completely master during entire life. The main problem is not that there are bad guys and good guys, but it is practically impossible to know them. The only solution is to take care of our own mind. After a long and intense experience face-to-face on a large variety of individuals with HuPoTest, I established that there are 4 main categories: (i) dominating; (ii) dominated; (iii) independent and (iv) not able to perform HuPoTest. The results are not available for ever, because they can transform instantly between them (flip-flop character). The first two are dependent each other, permanently involved in conflicts up to crime and suicide. The independent ones avoid any conflict and live in honest conditions. People not able to perform HuPoTest have their minds dominated by destructive emotions. Human mind is in permanent activity, so that conscious activity is perturbed by emotions. This is the main point of the present book: to reveal the composite structure of human mind by the existence of the active component involved in coherent thinking and an inert one perturbing the conscious activity. I invite any one who will decide to try HuPoTest to contact me for help without any obligation.
